

Ergon and meteoblue bring the weather of the world to the iPhone

meteo4me with 6-day weather forecast available in App Store now

Zürich/Basel, May 26, 2010 – The software company Ergon from Zürich and the weather experts of meteoblue from Basel together developed a worldwide weather application for the iPhone. The application called meteo4me supplies local weather forecasts for the next six days at any place in the entire world and presents all important weather parameters in hourly resolution. meteo4me is available in the App Store at a price of CHF 6.60 or EUR 4.99.

Ergon and meteoblue developed meteo4me in partnership since late 2009. meteo4me turns your iPhone into a mobile weather station and presents all relevant parameters – temperature, cloudiness, precipitation probability and intensity, wind speed, direction and gusts, and weather symbols in 4 screens for any location in the world, in currently six languages.

meteo4me always places the user in the center: more than five million predefined locations can be selected, as well as any location accessible on the world map, including mountains and seas. meteo4me supplies accurate forecasts for each exact location, not for the closest weather station. No matter whether you select a town, a remote mountain or a place in the sea: you get the same high forecast quality in the remote area as in the city.

The application shows the weather world-wide in 4 dimensions: for places, in a map overview, in several cloud layers and over time.

meteo4me makes an active contribution for the conservation of natural resources. The entire modeling chain as well as the programming and operating work are operated 100 per cent with renewable energy. Furthermore, meteo4me supports the WWF: A part of the revenue flows into climate projects.

“The success of our iPhone application iWeather.ch with the weather for Switzerland encouraged us in our decision to develop an application with the weather for the whole world”, says Patrick Burkhalter, managing director of Ergon. “meteoblue operates one of the best weather models in the whole world and we worked together very well. It will be interesting to see the world-wide potential.”

“Ergon and meteoblue are an ideal team”, confirms Karl Gutbrod, CEO of meteoblue. “The combination of the experience of Ergon in the development of technically solid and mature

Media release

applications with the weather expertise of meteoblue was the best basis for the development of a unique iPhone application. meteo4me is the first iPhone application to offer precise weather forecasts for every place on earth with hourly resolution.”

About meteoblue AG

meteoblue is a specialist for production of precise local weather forecasts of highest quality. meteoblue products and services are made for enterprises whose decisions depend on weather, and for users with a special interest in weather.

meteoblue calculates the forecasts based on its own modern computation models, and offers products and services for web pages, renewable energy production, building management and specialized weather applications.
